GymPal: Gym Personal Training App

Project document · Android MVP · Version 1.0 · 20 October 2026. GymPal is a working title and can be renamed at any time.

How to use this document

This is the single reference for the project. Chapters 1 to 4 explain what we are building and how every screen behaves. Chapter 5 holds the design prompts for Stitch. Chapters 6 to 8 hold the technical blueprint and the agile build plan, with a ready-to-paste prompt for every chunk of work. Chapter 9 lists the open questions. Update the document whenever a decision changes, so it always matches the app.

1. Project overview

1.1 Motive

Many people join a gym or start training at home without a clear routine. They do not know which exercises to pick, how to perform them correctly, or whether they are improving. GymPal gives them a guided routine with a short animated demonstration of every exercise, a 30-day plan, simple daily tracking and a history of everything they have done.

1.2 What we are building

An Android app (Kotlin, Jetpack Compose) with:

- A library of 51 animated exercises (the grey mannequin character), grouped by muscle, with sets, reps and rest suggestions that depend on the user's goal.
- Free training (Workouts) and structured training (30-day and weekly Plans). Both write into one shared history.
- Per-exercise Start and Finish tracking, set logging and sip-of-water reminders.
- A daily tracker (water, meals, streak), progress tracking (weight, measurements) and a profile with workout history.
- Everything works offline. Data is stored on the phone. No server and no running cost in version 1.

1.3 Who it is for

User type	Starting point	What the app should do
Heavy beginner	Overweight, muscles not yet conditioned for heavy loads	Lighter loads, bodyweight and machine work, more cardio, longer rest
Fit newcomer	Active but new to gym training	Teach form, build gym-specific strength steadily
Experienced lifter	Trains regularly and	Heavier compound lifts, more control over

User type	Starting point	What the app should do
	handles heavy loads	the plan
Women	All levels, including those who lift heavy	Same library and same logic. Defaults come from goal, strength level and limitations, never from gender alone

1.4 Scope

MVP (version 1.0): tile home screen, Workouts (goal, muscle, list, detail), per-exercise session tracking with water reminders, history, Plans (30-day, day setup, weekly), daily tracker, progress (weight and measurements), profile with setup, reminders.

Version 1.1 and later: fully custom plan builder, progress photos, richer charts, login with cloud backup, a bigger library (80 to 100 exercises), home-screen widgets.

Out of scope for now: voice instructor, calorie counting, social features, payments, iOS.

1.5 What counts as the first usable build

On a real phone the user opens the app, taps Workouts, picks a goal and a muscle, sees the animated exercises, starts and finishes an exercise, logs sets, and sees it in history. Everything after that is widening the app.

2. Decisions locked so far

#	Area	Decision
1	Navigation	Home screen with five large horizontal tiles stacked top to bottom, each slightly tilted. No bottom bar. Tapping a tile opens that section and Back returns to Home
2	Tiles	Workouts, Plans, Daily tracker, Progress, Profile
3	Login	Skipped in the first builds. The profile is stored on the phone. Login and cloud come later
4	Workouts flow	Goal picker, then muscle tiles, then exercise list, then exercise detail
5	Muscle tiles	Warm-up and stretch, Chest, Back, Shoulders, Biceps, Triceps, Legs, Core, Cardio
6	Exercise list	Each row shows a small looping animation, the name, and one or two lines such as sets, reps and rest for the user's goal
7	Exercise detail	Larger animation, steps, target muscle, equipment, common mistakes

#	Area	Decision
8	Tracking	Start and Finish buttons per exercise, not one timer for the whole workout. Sets are logged during the exercise
9	Finishing the day	After the last exercise the app asks “Done for today?” and saves the summary. The user may finish later, for example at home, and an unfinished session stays open
10	Water reminders	A short popup every 10 to 15 minutes while an exercise is active, which disappears on its own. No voice instructor in version 1
11	Two ways to train	Workouts is free training. Plans is structured training. Both write into the same history
12	30-day plan	The first time a muscle day appears, the user picks 4 exercises from the goal-curated list. The choice is locked and repeats every time that muscle day returns. It can be edited at any time
13	Night-before setup	The user can open tomorrow’s day in Plans and choose its exercises in advance
14	Goals	Weight loss, Muscle building, Lean body or toning, Strength and endurance, General fitness. Chosen once in profile setup, changeable later
15	Goal-based lists	Each goal has curated exercises and sets and reps for every muscle group. In the data this is one prescription row per exercise per goal, so it is content work, not extra code
16	History and plan status	Past history lives in Profile. Current plan status, such as Day 12 of 30, shows at the top of Plans
17	Storage	Everything is stored on the phone with Room. The clips are bundled inside the app. No server cost
18	Build method	Design every screen in Stitch first, extract a style guide, then build in vertical slices with an AI coding agent in Android Studio

3. Goals and fitness profile

3.1 The five goals

The defaults below are sensible starting points for planning. Have a qualified trainer review them before release.

Goal	Who it is for	Starting defaults
Weight loss	Carrying extra weight, wants fat loss	3 sets of 15 to 20 reps, rest 30 to 45 s, bodyweight, machine and cardio exercises first
Muscle building	Wants size and strength	4 sets of 8 to 12 reps, rest 60 to 90 s (up to 120 s on heavy compounds), compound lifts first
Lean body or toning	Wants a defined look without bulk	3 sets of 12 to 15 reps, rest 45 to 60 s, moderate loads
Strength and endurance	Fit or experienced, wants to lift heavier or last longer	Heavy compounds at 4 to 5 sets of 3 to 6 reps with 2 to 3 min rest, plus higher-rep finishers
General fitness	Wants to stay active and healthy	3 sets of 10 to 12 reps, rest 60 s, balanced mix

3.2 Profile setup questions

1. **Goal:** pick one of the five.
2. **About you:** name, age, height, weight. Gender is optional and only used for labels, never to restrict exercises.
3. **Experience:** never trained, under 6 months, 6 months to 2 years, over 2 years.
4. **Quick strength check:** how many push-ups can you do with good form (0 to 5, 6 to 15, 16 or more), and how many days a week can you train (2 to 6).
5. **Limitations (multi-select):** none, knees, lower back, shoulders, wrists.

The answers produce a level: **Starter, Intermediate or Advanced**. Starter gets 2 to 3 sets, bodyweight and machine options first, and longer rest. Limitations hide or replace exercises that are tagged as stressful for that joint. Goal and level together choose the defaults.

3.3 Safety note

Show once at first launch: “This app gives general fitness guidance, not medical advice. If you have a health condition, check with a doctor before you start.”

4. Screen specifications

4.1 Navigation map

- **Home** (five tiles)
    - **Workouts:** Goal picker → Muscle tiles → Exercise list → Exercise detail → Exercise session → Workout summary
    - **Plans:** Plans home (plan status, 30-day grid, weekly view) → Day setup (pick 4) → Exercise session → Workout summary
    - **Daily tracker:** Today (water, meals, streak)
    - **Progress:** Stats, body measurements

    - **Profile:** Profile and goals, History (calendar and day detail), Reminders, Settings
- **First launch only:** Safety note → Profile setup (5 steps) → Home

4.2 Screens

S1 Home. Greeting with the user's name and today's date. Five large tilted tiles fill the screen: Workouts, Plans, Daily tracker, Progress, Profile. Each has an icon, title and one-line subtitle. An optional strip shows today's planned muscle if a plan is active.

S2 Profile setup. Five short steps from section 3.2 with a progress indicator and a Next button. Skippable only after the goal is chosen.

S3 Goal picker (Workouts). Five goal cards. The saved goal is pre-selected, so a returning user can tap Continue. The user may switch goal for a single session.

S4 Muscle tiles. A two-column grid of nine tiles: Warm-up and stretch, Chest, Back, Shoulders, Biceps, Triceps, Legs, Core, Cardio.

S5 Exercise list. Scrollable list for the chosen muscle and goal. Each row: small looping animation, exercise name, equipment, and a line such as "4 sets · 8 to 12 reps · rest 60 s". Tapping a row opens the detail. A checkbox lets the user select exercises for today's session, then a Start button begins the first one.

S6 Exercise detail. Large animation, target and secondary muscles, equipment, numbered steps, common mistakes, the goal-based sets, reps and rest, and a Start button.

S7 Exercise session. Shows the animation, exercise name, a running timer, the set list with reps and weight fields (pre-filled from the last time), a Log set button, and a Finish exercise button. Water reminder banners appear here.

S8 Workout summary. Shown after the last exercise: "Done for today?" Confirm to save. Shows total time, exercises done, total sets, estimated calories and a streak update.

S9 Plans home. Top card with plan status (for example Day 12 of 30, today's muscle). Below, the 30-day grid (done, today, upcoming, rest) and a link to the weekly view.

S10 Day setup. Opens the first time a muscle day appears, or when the user edits. Shows the goal-curated exercises for that muscle with checkboxes. The user ticks 4 and confirms. Unticked exercises disappear for that muscle day. A Save locks the choice for every future day of that muscle.

S11 Weekly schedule. Seven day cards, Monday to Sunday, each showing the assigned muscle or Rest. The user can swap days.

S12 Daily tracker. Today's workout status, water glasses with plus and minus buttons, a meals note, and the current streak with badges.

S13 Progress. Weight trend chart, a measurements list (chest, waist, hips, arm, thigh) with an Add entry button.

S14 Profile. Name, goal, level, current plan name, and rows to History, Reminders and Settings.

S15 History. A calendar with workout days marked. Tapping a day shows every exercise, set, rep and weight done, whether it came from Plans or free training.

S16 Reminders and settings. Water reminder interval (10, 15 or 20 min), daily reminders, units (kg or lb), theme.

4.3 Session rules

- Each exercise has its own state: Not started, In progress, Finished.
- Starting an exercise creates a workout session for the day if none is open. All exercises done that day join the same session.
- An unfinished session survives closing the app and is offered again on Home and in Daily tracker.
- Each set is logged as it is done, with weight and reps pre-filled from the previous session. Recommended default: one tap to confirm a set.
- Finishing the last selected exercise asks “Done for today?”. Confirming sets the session to Done and updates the streak.

4.4 Plan rules

- A 30-day plan assigns a muscle (or Rest) to each day. The default rotation depends on the goal and the days per week from profile setup.
- The first time a muscle appears, the user chooses 4 exercises (S10). The selection is stored for that plan and muscle, and every later day with the same muscle uses it automatically.
- The user can open S10 again at any time to swap exercises. Changes apply to future days only.
- Any day can be prepared in advance, for example the evening before.

4.5 Water reminder rules

- Active only while an exercise is In progress.
- Interval from settings, default 15 minutes.
- A banner reads “Time for a sip of water” and disappears by itself after about 5 seconds.
- No sound or voice in version 1. If the app is in the background, send a normal notification that uses the same timing.

4.6 Content gap to fix

The “pick 4 from about 10” idea needs roughly 8 to 10 exercises per muscle. The current 51-exercise library has only 2 biceps and 4 triceps exercises, and 6 to 8 for most other muscles. Plan for the MVP to work with picking 3 or 4 from what exists, and add 35 to 40 more exercises (concentration curl, preacher curl, incline curl, skull crusher, cable crossover variants and so on) in version 1.1. Make sure every goal has at least 4 suitable exercises per muscle.

5. Design with Stitch

5.1 Workflow

1. Paste the **Style block** below at the top of every Stitch prompt, followed by one screen prompt.
2. Generate the screens in the order of the prompts. Redo any screen that drifts from the style, and do not move on until the first three screens look right together.

3. Export each approved screen (image and code). Keep them in one folder named by screen ID (S1, S3 and so on).
4. Share the exports. I will write the **style guide** from the exact values in the exported code and add it to this document.
5. Every coding prompt then refers to the matching screenshot and the style guide.

5.2 Style block (paste at the top of every screen prompt)

Mobile app, Android, portrait 9:16, modern fitness app, dark theme. Background deep navy #0B1020, surfaces #151C30 with a subtle 1px border #243049, primary accent electric blue #38BDF8, success green #22C55E, warning amber #F59E0B, text white #F4F7FB and muted #94A3B8. Typography: Poppins SemiBold for headings, Inter for body, large readable sizes (headings 24 to 28sp, body 15 to 16sp). Cards have 20px rounded corners, soft shadow, 16px padding and 12px gaps. Primary buttons are full-width pills, 52px high, blue fill with dark text. Icons are simple rounded line icons. Exercise visuals show a faceless matte grey mannequin on a dark navy studio background with soft blue rim light so images blend with the theme. Feeling: powerful, clean, motivating, uncluttered. No bottom navigation bar anywhere.

5.3 Screen prompts

P1 Home (S1)

Screen: Home. Small greeting top left ("Hello, Rahul") and today's date. Below, five large horizontal rectangular tiles stacked vertically and filling the screen, each rotated slightly, alternating about -3 and +3 degrees, like fanned cards. Tiles in order: Workouts (dumbbell icon, "Exercise library"), Plans (calendar icon, "30-day and weekly"), Daily tracker (water drop icon, "Water, meals, streak"), Progress (chart icon, "Weight and measures"), Profile (person icon, "Account and history"). Each tile uses a different tint from the palette, with a large icon on the left, bold title, one-line subtitle and a small chevron on the right.

P2 Goal picker (S3)

Screen: Choose your goal. Back arrow and title "What is your goal?". Five tall selectable cards stacked vertically: Weight loss, Muscle building, Lean body or toning, Strength and endurance, General fitness. Each card has an icon, the title and a one-line description. One card is shown selected with a blue outline. Full-width Continue button at the bottom.

P3 Muscle tiles (S4)

Screen: Choose a muscle group. Back arrow, title "Workouts", and a small chip showing the selected goal. A two-column grid of nine rounded tiles: Warm-up and stretch, Chest, Back, Shoulders, Biceps, Triceps, Legs, Core, Cardio. Each tile shows the grey mannequin with that muscle area glowing blue, and the name below.

P4 Exercise list (S5)

Screen: Exercise list for Chest. Back arrow, title "Chest", goal chip. Scrollable list of exercise rows. Each row has a small square looping animation preview of the mannequin on the left, the exercise name in bold, the equipment in muted text, and a line "4 sets · 8 to 12 reps · rest 60 s" with small icons. A checkbox on the right of each row. A sticky Start workout button at the bottom with a counter such as "4 selected".

P5 Exercise detail (S6)

Screen: Exercise detail for Barbell bench press. Large animation area at the top showing the mannequin. Exercise name, chips for target muscle (Chest), secondary muscles and equipment. A card with the prescription "4 sets · 8 to 12 reps · rest 60 s". Numbered steps section, a "Common mistakes" card, and a sticky Start button.

P6 Exercise session (S7)

Screen: Active exercise. Top: exercise name and a running timer. Middle: looping animation of the mannequin. Below: a list of sets (Set 1, 2, 3, 4) each with weight and reps fields and a check button; completed sets are

green. A prominent Log set button and a secondary Finish exercise button. Show a small banner at the top that says “Time for a sip of water” with a water drop icon.

P7 Workout summary (S8)

Screen: Workout summary. Headline “Done for today?”, a row of four stat cards (time, exercises, sets, estimated calories), a list of the exercises completed with tick marks, a streak flame with the day count, and two buttons: Save workout (primary) and Keep going (secondary).

P8 Plans home (S9)

Screen: Plans. Top card: “Day 12 of 30” with a progress bar and “Today: Chest”. Below, a 30-day grid of rounded day cells in 6 columns, with states: done (green tick), today (blue outline), upcoming (muted), rest day (amber moon icon). A link row “Weekly schedule” at the bottom.

P9 Day setup (S10)

Screen: Choose your Chest exercises. Helper text “Pick 4. We will repeat these every chest day.” List of 8 exercise rows with animation thumbnail, name, sets and reps line and a checkbox. Four are ticked. A counter “4 of 4 selected” and a Save button at the bottom.

P10 Weekly schedule (S11)

Screen: Weekly schedule. Seven stacked cards, Monday to Sunday. Each shows the day name and the muscle for that day (Chest, Back, Shoulders, Legs, Biceps and Triceps, Core, Rest) with an icon and a small drag handle on the right. Today is highlighted in blue.

P11 Daily tracker (S12)

Screen: Daily tracker. Top card: today’s workout status with a Continue button. Water card: eight glass icons, filled by progress, with plus and minus buttons and “5 of 8 glasses”. Meals card with a short note field. Streak card with a flame icon, “6 day streak” and a row of small badges.

P12 Progress (S13)

Screen: Progress. A line chart of body weight over the last 8 weeks with the accent blue line. Below, a card list of measurements (chest, waist, hips, arm, thigh) each with the latest value and a small change arrow. An Add entry button.

P13 Profile (S14)

Screen: Profile. Round avatar with initials, the name, and chips for goal and level. A card “Current plan: 30-day muscle building, Day 12”. Rows with chevrons: Workout history, Reminders, Settings, Help.

P14 History (S15)

Screen: Workout history. A month calendar with workout days marked by blue dots. Below, the selected day’s workout: a list of exercises, each with sets, reps and weight in a compact table, and a total time at the top.

P15 Profile setup (S2)

Screen: Profile setup step 3 of 5, Experience. A progress bar at the top, title “How long have you been training?”, four large selectable options (Never trained, Under 6 months, 6 months to 2 years, Over 2 years), and a Next button.

5.4 Style guide (filled in after export)

Token	Value from Stitch export
Background	to be filled
Surface and border	to be filled
Primary, success, warning	to be filled

Token	Value from Stitch export
Text and muted text	to be filled
Heading font and sizes	to be filled
Body font and sizes	to be filled
Card corner radius and padding	to be filled
Button height and shape	to be filled
Home tile tilt angles	to be filled

6. Technical blueprint

6.1 Stack

Part	Choice	Why
Language and UI	Kotlin, Jetpack Compose, Material 3	Android standard and best supported by AI agents
Architecture	MVVM, one ViewModel per screen	Keeps each screen simple
Database	Room	Stores exercises, plans and logs on the phone
Small settings	DataStore	Goal, units, reminder interval, onboarding flag
Navigation	Navigation Compose	One route per screen
Wiring	Hilt	Standard way to provide the database and ViewModels
Images and animation	Coil with animated WebP and GIF support	Plays the exercise loops
Charts	A Compose chart library chosen in epic E6	Weight trend
Reminders	WorkManager and notifications	Water and workout reminders

No other libraries without approval.

6.2 Folder structure

```
app/src/main/
 java/com/gympal/app/
   data/       Room entities, DAOs, database, repositories, JSON loader
   domain/     models and use cases (BuildPlan, CalculateStreak)
```

```
  ui/
    theme/      Color, Type, Shape, Theme
    components/ TiltedTile, ExerciseRow, MuscleTile, SetRow, WaterBanner
    screens/    home, workouts, plans, tracker, progress, profile, session
  navigation/   routes and NavGraph
  reminders/    workers and notification code
assets/
  exercises.json
  exercises/    ex_<slug>.webp and ex_<slug>_thumb.webp
```

6.3 Navigation routes

Route	Screen
home	S1 Home tiles
setup	S2 Profile setup
goal_picker	S3 Goal picker
muscles/{goal}	S4 Muscle tiles
exercises/{goal}/{muscle}	S5 Exercise list
exercise/{id}	S6 Exercise detail
session/{exerciseId}	S7 Exercise session
summary/{sessionId}	S8 Workout summary
plans	S9 Plans home
plan_setup/{planId}/{muscle}	S10 Day setup
weekly	S11 Weekly schedule
tracker	S12 Daily tracker
progress	S13 Progress
profile	S14 Profile
history and history_day/{date}	S15 History
settings	S16 Reminders and settings

6.4 Data model

All ids are UUID strings so cloud sync can be added later without rebuilding the database.

Table	Key fields	Purpose
Exercise	id, name, muscle, secondaryMuscles, equipment, difficulty, media, thumb, steps, mistakes, jointStress	The library

Table	Key fields	Purpose
GoalPrescription	id, exerciseId, goal, sets, reps, restSec, recommended, priority	Sets and reps per exercise per goal (five rows per exercise)
UserProfile	id, name, goal, level, heightCm, weightKg, age, gender (optional), limitations, daysPerWeek	The user
Plan	id, name, type (THIRTY_DAY, WEEKLY, CUSTOM), goal, startDate, active	A plan
PlanDay	id, planId, dayIndex, muscle, isRest	One day of a plan
PlanMuscleSelection	id, planId, muscle, exerciseId, position	The locked 4 exercises per muscle
WorkoutSession	id, date, source (FREE or PLAN), planDayId, startedAt, finishedAt, status, totalSec, estCalories	One day's workout
ExerciseLog	id, sessionId, exerciseId, startedAt, finishedAt, status	One exercise inside a session
SetLog	id, exerciseLogId, setNumber, reps, weightKg, completed	One set
DailyEntry	id, date, waterGlasses, mealsNote	Daily tracker
BodyMeasurement	id, date, weightKg, chest, waist, hips, arm, thigh	Progress
Reminder	id, type, timeOfDay, intervalMin, enabled	Reminders

DataStore keys: onboardingDone, goal, units, theme, waterIntervalMin.

6.5 Exercise data file (assets/exercises.json)

One entry per exercise. The prescriptions list holds the five goal rows, so changing sets and reps never needs a code change.

```
{
 "id": "ex_barbell_bench_press",
 "name": "Barbell bench press",
 "muscle": "CHEST",
 "secondaryMuscles": ["TRICEPS", "SHOULDERS"],
 "equipment": "Barbell, bench",
 "difficulty": "INTERMEDIATE",
 "media": "ex_barbell_bench_press.webp",
 "thumb": "ex_barbell_bench_press_thumb.webp",
 "steps": ["Lie on a flat bench...", "Lower the bar to mid-chest..."],
 "mistakes": ["Bouncing the bar off the chest"],
 "jointStress": ["SHOULDERS"],
 "prescriptions": [
```

```
  { "goal": "MUSCLE_BUILDING", "sets": 4, "reps": "8-12", "restSec": 90, "recommended": true },
  { "goal": "WEIGHT_LOSS", "sets": 3, "reps": "15-20", "restSec": 45, "recommended": false }
 ]
}
```

6.6 Media rules

- One looping clip of about 4 seconds per exercise in animated WebP or short MP4, plus a still thumbnail. Clip up to 500 KB, thumbnail up to 40 KB.
- Same character, camera framing, background and lighting for every clip.
- File names follow the exercise id: ex_<slug>.webp and ex_<slug>_thumb.webp.
- Budget for 51 clips is about 25 to 30 MB inside the app.

7. Agile build plan

7.1 Working rules

1. **Vertical slices.** Each epic goes all the way from data to screen and works on a real phone before the next epic starts.
2. **One chunk at a time.** Paste one prompt, let the agent finish, test on the phone, then commit to Git with the chunk ID as the message (for example C1.3).
3. **Definition of done for every chunk:** it compiles, runs on a real phone, matches the Stitch screenshot where one exists, uses theme tokens only, and the agent has listed anything that is placeholder.
4. **If the agent fails twice on the same problem,** stop, paste the error and a screenshot into our chat, and we will rewrite the instruction.
5. **No surprise edits.** A prompt only touches the files its task needs.

7.2 Agent context block (paste at the start of every coding prompt)

```
PROJECT CONTEXT (read first)
Android app GymPal. Kotlin, Jetpack Compose, Material 3, MVVM (one ViewModel per screen), Room, DataStore, Navigation Compose, Hilt, Coil, WorkManager. Offline only, no network code. Package com.gympal.app. Folders: data/, domain/, ui/theme/, ui/components/, ui/screens/, navigation/, reminders/.
RULES
1. Do only the task below and nothing extra.
2. Add no libraries beyond the list above without asking me.
3. Use theme tokens from ui/theme. Never hard-code colors, sizes or fonts.
4. All ids are UUID strings.
5. Say clearly whenever you use placeholder data.
6. Build the project and fix compile errors yourself before you finish.
7. End with: files changed, how to test on a phone, and anything unfinished.
```

7.3 Epics at a glance

Epic	Name	Outcome	Release
E0	Foundation	Project, theme, home tiles, navigation shell	MVP
E1	Workouts library	Goal, muscle, animated exercise list and detail	MVP
E2	Session tracking	Start and finish, set logging, water reminders,	MVP

Epic	Name	Outcome	Release
		summary	
E3	History	Calendar and day details in Profile	MVP
E4	Plans	30-day plan, day setup with locked picks, weekly view	MVP
E5	Daily tracker	Water, meals, streak	MVP
E6	Progress	Weight and measurements with a chart	MVP
E7	Profile, setup and reminders	Onboarding, profile, notifications, settings	MVP
E8	Polish and release	Empty states, dark mode check, icon, testing, Play Store	MVP
E9	Version 1.1	Custom plan builder, photos, bigger library, backup	Later

Build order is E0 to E8. Epics E1 and E2 together give the first usable build described in section 1.5.

7.4 Epic E0: Foundation

Story: As a user I see five tiles on Home and can open any section.

C0.1 Project setup

[Paste Context Block]
TASK C0.1: In the existing empty Compose project, add the dependencies from the stack list (Compose BOM and Material 3, Navigation Compose, Room with KSP, Hilt, DataStore, Coil with GIF and WebP support, WorkManager) using the latest stable versions. Set up Hilt (Application class and entry point). Create the empty folder structure from the blueprint. Do not build any screens.
DONE WHEN: the app builds and shows a blank screen on my phone.

C0.2 Theme

[Paste Context Block]
TASK C0.2: Create ui/theme (Color.kt, Type.kt, Shape.kt, Theme.kt) using only the values in the attached style guide. Dark theme is the default. Add the fonts Poppins and Inter. Create a preview screen that shows every color, text style, card and button style.
DONE WHEN: the preview screen matches the style guide.

C0.3 Home tiles

[Paste Context Block]
TASK C0.3: Build HomeScreen to match the attached Stitch screenshot S1 exactly. Create a reusable TiltedTile composable in ui/components with parameters title, subtitle, icon, tint, rotation and onClick. Five tiles: Workouts, Plans, Daily tracker, Progress, Profile, with alternating rotation of about -3 and +3 degrees as in the style guide.
DONE WHEN: Home looks like the screenshot on my phone.

C0.4 Navigation shell

[Paste Context Block]
TASK C0.4: Add Navigation Compose with the routes home, workouts, plans, tracker, progress and profile from section 6.3. Each tile opens a placeholder screen with a title and a Back button. System Back returns to

Home. No bottom bar.
DONE WHEN: every tile opens its placeholder and Back returns to Home.

7.5 Epic E1: Workouts library

Stories: As a user I pick my goal and a muscle and see animated exercises with the sets and reps for my goal. As a user I open an exercise to learn how to do it.

C1.1 Exercise tables

[Paste Context Block]
TASK C1.1: Create Room entities Exercise and GoalPrescription exactly as in section 6.4, with DAOs, the AppDatabase, type converters for the list fields, and an ExerciseRepository. Expose: all exercises for a muscle, one exercise by id, and the prescription for an exercise and goal.
DONE WHEN: the project builds and a small unit test inserts and reads one exercise.

C1.2 Seed the data

[Paste Context Block]
TASK C1.2: Add assets/exercises.json using the format in section 6.5 with 6 sample exercises (two chest, two legs, two core), each with five goal prescriptions. On first launch only, load the file into Room (track this with a DataStore flag). Use placeholder media names.
DONE WHEN: after a fresh install the database holds the 6 exercises, and a debug log lists them.

C1.3 Goal picker

[Paste Context Block]
TASK C1.3: Build GoalPickerScreen to match Stitch screenshot S3. Five goal cards. Save the chosen goal in DataStore and pre-select it next time. Workouts tile now opens this screen, and Continue goes to the muscles route with the goal.
DONE WHEN: the chosen goal survives closing and reopening the app.

C1.4 Muscle tiles

[Paste Context Block]
TASK C1.4: Build MuscleTilesScreen to match Stitch screenshot S4: a two-column grid of nine tiles (Warm-up and stretch, Chest, Back, Shoulders, Biceps, Triceps, Legs, Core, Cardio) with a chip for the current goal. Tapping a tile opens the exercise list route. Create a MuscleTile composable in ui/components.
DONE WHEN: all nine tiles open the list route with the right muscle.

C1.5 Exercise list

[Paste Context Block]
TASK C1.5: Build ExerciseListScreen to match Stitch screenshot S4-list (P4). Each row shows the thumbnail (load with Coil from assets, use a placeholder if the file is missing), the name, the equipment, and the line sets, reps and rest from the prescription for the current goal. Add a checkbox per row, a sticky Start button with the selected count, and tap-on-row to open the detail route. Create ExerciseRow in ui/components.
DONE WHEN: the list shows the right prescription when I change goal.

C1.6 Exercise detail

[Paste Context Block]
TASK C1.6: Build ExerciseDetailScreen to match Stitch screenshot S6. Show the large looping animation (Coil), target and secondary muscles, equipment, the prescription for my goal, numbered steps, common mistakes and a Start button (does nothing yet).
DONE WHEN: a sample exercise shows all fields and the animation loops.

C1.7 Full content

[Paste Context Block]
TASK C1.7: Replace the sample exercises.json with the full file I attach (51 exercises, five prescriptions each) and add all media files to assets/exercises. Write a debug check that reports any exercise that is missing a

media file, a thumbnail, or any of the five goals, and any exercise whose muscle is not one of the nine muscle tiles. Fix the loader if needed.
DONE WHEN: the check reports zero problems and every muscle tile shows its exercises.

7.6 Epic E2: Session tracking

Stories: As a user I start and finish each exercise on its own. I log my sets. I get a sip-of-water reminder while I train. I finish the day and see a summary. I can come back to an unfinished session later.

C2.1 Session tables

[Paste Context Block]
TASK C2.1: Create Room entities WorkoutSession, ExerciseLog and SetLog exactly as in section 6.4, with DAOs and a WorkoutRepository. Add queries: the open session for today (if any), the exercise logs of a session, the sets of an exercise log, and the last logged weight and reps for an exercise.
DONE WHEN: the project builds and a unit test creates a session with one exercise and two sets.

C2.2 Start and finish an exercise

[Paste Context Block]
TASK C2.2: Implement a SessionViewModel. Start on an exercise creates a WorkoutSession for today if none is open (source FREE), adds an ExerciseLog with status IN_PROGRESS and records startedAt. Finish sets status FINISHED and finishedAt. Wire the Start buttons on the list and detail screens (selected exercises run one after another). State must survive process death because it lives in Room.
DONE WHEN: I start an exercise, close the app, reopen it, and the exercise is still in progress.

C2.3 Session screen and set logging

[Paste Context Block]
TASK C2.3: Build ExerciseSessionScreen to match Stitch screenshot S7 (P6). Show the exercise name, a running timer, the looping animation, and a list of sets from the prescription. Each set has weight and reps fields pre-filled from the last logged values, and one tap on the check button saves the set to Room. Add a Finish exercise button that moves to the next selected exercise.
DONE WHEN: logged sets are saved and the next session pre-fills the last values.

C2.4 Water reminder

[Paste Context Block]
TASK C2.4: Add a WaterBanner composable that appears on the session screen while an exercise is IN_PROGRESS, every N minutes (N from DataStore, default 15, options 10, 15, 20), reads “Time for a sip of water”, and disappears by itself after 5 seconds. Add a debug option to set N to 1 minute for testing. No sound. Background notifications come later in epic E7.
DONE WHEN: with N set to 1 minute the banner shows and auto-dismisses, and it stops after Finish.

C2.5 Finish the day and summary

[Paste Context Block]
TASK C2.5: After the last selected exercise, show a Done for today? dialog. Confirm sets the session to DONE with totalSec and a simple estimated calories value (minutes trained times 5, labelled estimated). Build WorkoutSummaryScreen to match Stitch screenshot S8 showing time, exercises, sets, estimated calories and the exercise list.
DONE WHEN: a finished workout shows correct totals and the session is saved as DONE.

C2.6 Resume an unfinished session

[Paste Context Block]
TASK C2.6: On Home, if there is an open session from today or an earlier day, show a Resume card above the tiles with the exercise in progress or the next one. Tapping it opens the session screen. Let me finish an old session from the summary dialog.
DONE WHEN: I can close the app mid-workout, reopen it, and resume or finish the session later.
